## 2024\_28\_III\_OOPS Using Java Lab

### **REC\_2028\_OOPS using Java\_Week 9\_CY**

Attempt : 1

Total Mark : 40

Marks Obtained : 40

#### **Section 1 : Coding**

##### **1. Problem Statement**

Sarah, a warehouse manager, is managing a list of product names in her store's inventory system. She needs to perform basic operations like adding (inserting) new products, removing products that are sold out or discontinued, displaying all the products in stock, and searching for a specific product in the inventory list.

Sarah's goal is to manage the inventory using a list of product names (strings). The system allows her to perform the following operations using ArrayList:

Insert a Product: Sarah adds a new product to the inventory.  
Delete a Product: Sarah removes a product from the inventory when it's sold or discontinued.  
Display the Inventory: Sarah checks all the products currently available in the inventory.  
Search for a Product: Sarah searches for a

specific product in the inventory to check if it's available.

#### ***Input Format***

The input consists of multiple space-separated values representing different operations on a product list. Each operation follows a specific format:

1 <product\_name> - Adds <product\_name> to the product list.

2 <product\_name> - Removes <product\_name> from the product list if it exists.

3 - Print all products currently on the list.

4 <product\_name> - Checks if <product\_name> exists in the list.

#### ***Output Format***

The output displays,

For (choice 1) prints, " <item> has been added to the list."

For (choice 2) prints, " <item> has been removed from the list."

For (choice 3) prints, "Items in the list:" followed by each item in the list on a new line, or "The list is empty." if the list is empty.

For (choice 4) prints," <item> is found in the list." or " <item> not found in the list."

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 1 apple 1 banana 2 apple 3 4 apple

Output: apple has been added to the list.

banana has been added to the list.

apple has been removed from the list.

Items in the list:

banana

apple not found in the list.

#### ***Answer***

```
import java.util.ArrayList;
```

```
import java.util.Scanner;

class StringListOperations {
    public static void insertItem(ArrayList<String> list, String item) {
        list.add(item);
        System.out.println(item + " has been added to the list.");
    }
    public static void deleteItem(ArrayList<String> list, String item) {
        if (list.remove(item)) {
            System.out.println(item + " has been removed from the list.");
        } else {
            System.out.println(item + " not found in the list.");
        }
    }
    public static void displayList(ArrayList<String> list) {
        if (list.isEmpty()) {
            System.out.println("The list is empty.");
        } else {
            System.out.println("Items in the list:");
            for (String s : list) {
                System.out.println(s);
            }
        }
    }
    public static void searchItem(ArrayList<String> list, String item) {
        if (list.contains(item)) {
            System.out.println(item + " is found in the list.");
        } else {
            System.out.println(item + " not found in the list.");
        }
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        ArrayList<String> list = new ArrayList<>();

        String input = sc.nextLine();
        String[] commands = input.split(" ");
    }
}
```

```
int i = 0;
while (i < commands.length) {
    int choice = Integer.parseInt(commands[i]);
    switch (choice) {
        case 1:
            if (i + 1 < commands.length) {
                StringListOperations.insertItem(list, commands[i + 1]);
                i += 2;
            } else {
                System.out.println("No string provided for insertion.");
                i++;
            }
            break;
        case 2:
            if (i + 1 < commands.length) {
                StringListOperations.deleteItem(list, commands[i + 1]);
                i += 2;
            } else {
                System.out.println("No string provided for deletion.");
                i++;
            }
            break;
        case 3:
            StringListOperations.displayList(list);
            i += 1;
            break;
        case 4:
            if (i + 1 < commands.length) {
                StringListOperations.searchItem(list, commands[i + 1]);
                i += 2;
            } else {
                System.out.println("No string provided for searching.");
                i++;
            }
            break;
    }
}
}
```

Status : Correct

Marks : 10/10

## 2. Problem Statement

A teacher is filtering a list of words provided by students. Some words contain too many vowels, making them difficult for a spelling competition. The teacher decides to remove all words that contain more than two vowels.

Help the teacher to implement it using ArrayList.

### ***Input Format***

The first line contains an integer N, representing the number of words in the list.

The next N lines contain a string representing the words (one per line).

### ***Output Format***

The output consists of words that contain two or less than two vowels, printed in the same order they appeared in the input. Each word is printed on a new line.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 1  
sri

Output: sri

### ***Answer***

```
import java.util.ArrayList;
import java.util.Scanner;

class VowelFilter {
    public static void filterWords(int n, Scanner sc) {
        ArrayList<String> words = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            words.add(sc.nextLine());
        }
        for (String word : words) {
            if (countVowels(word) <= 2) {
                System.out.println(word);
            }
        }
    }
}
```

```
        }
    }

private static int countVowels(String word) {
    int count = 0;
    for (char c : word.toCharArray()) {
        if ("aeiou".indexOf(c) != -1) {
            count++;
        }
    }
    return count;
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.nextLine();
        VowelFilter.filterWords(n, sc);
        sc.close();
    }
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Rahul is working on a list manipulation problem where he needs to reverse a specific subarray using a stack. Given an array and two indices l and r, he wants to reverse only the portion of the array from index l to r (both inclusive) while keeping the rest of the array unchanged.

Since Rahul wants to solve this problem efficiently, he decides to use a stack to reverse the subarray in  $O(r - l)$  time.

Your task is to help Rahul by implementing this functionality.

#### ***Input Format***

The first line contains an integer n, the size of the array.

The second line contains n space-separated integers arr[i].

The third line contains two integers l and r, denoting the start and end indices of the subarray to reverse.

Note: The array follows 0-based indexing.

### ***Output Format***

The output prints the modified array after reversing the subarray between indices l and r.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 6

1 2 3 4 5 6

1 4

Output: 1 5 4 3 2 6

### ***Answer***

```
import java.util.*;

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        int[] arr = new int[n];
        for (int i = 0; i < n; i++) {
            arr[i] = sc.nextInt();
        }
        int l = sc.nextInt();
        int r = sc.nextInt();
        reverseSubarray(arr, l, r);
        for (int i = 0; i < n; i++) {
            System.out.print(arr[i] + " ");
        }
        sc.close();
    }
}
```

```
    }
    public static void reverseSubarray(int[] arr, int l, int r) {
        Stack<Integer> stack = new Stack<>();
        for (int i = l; i <= r; i++) {
            stack.push(arr[i]);
        }
        for (int i = l; i <= r; i++) {
            arr[i] = stack.pop();
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Sanjay is working on a program to merge two sorted linked lists into a single sorted list using Java's `LinkedList` class from the Collections framework. Given two sorted linked lists, he wants to merge them while maintaining the sorted order.

Write a Java program that:

Reads two sorted linked lists. Merges them into a single sorted linked list. Prints the merged list in ascending order.

##### ***Input Format***

The first line contains an integer  $m$  (the size of the first linked list).

The second line contains  $m$  space-separated integers (sorted).

The third line contains an integer  $n$  (the size of the second linked list).

The fourth line contains  $n$  space-separated integers (sorted).

##### ***Output Format***

The output prints the merged linked list as space-separated integers.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 2

5 10

3

1 3 8

Output: 1 3 5 8 10

### **Answer**

```
import java.util.*;
class MergeSortedLinkedLists {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int m = sc.nextInt();
        LinkedList<Integer> list1 = new LinkedList<>();
        for (int i = 0; i < m; i++) {
            list1.add(sc.nextInt());
        }
        int n = sc.nextInt();
        LinkedList<Integer> list2 = new LinkedList<>();
        for (int i = 0; i < n; i++) {
            list2.add(sc.nextInt());
        }
        LinkedList<Integer> merged = new LinkedList<>();
        while (!list1.isEmpty() && !list2.isEmpty()) {
            if (list1.peekFirst() <= list2.peekFirst()) {
                merged.add(list1.removeFirst());
            } else {
                merged.add(list2.removeFirst());
            }
        }
        while (!list1.isEmpty()) {
            merged.add(list1.removeFirst());
        }
        while (!list2.isEmpty()) {
            merged.add(list2.removeFirst());
        }
        for (int num : merged) {
            System.out.print(num + " ");
        }
    }
}
```

```
    } } sc.close();  
}
```

**Status :** Correct
